**ABSTRACTED-PUB-NO:** JP 10307782 A

**BASIC-ABSTRACT:**

The system consists of gateways (2A-2N) through which clients (3A-3N) accesses the main server (1). A gateway management server (4) is provided which stores the load condition and load factors of each gateway.

The usage condition of the gateways are determined using the database. Whenever a client requests a gateway connection for accessing the server, a communication unit (42) in management server directs the client towards the gateway having the minimum load.

**ADVANTAGE** - Ensures continuous communication between client and server. Improves communication stability.
